00:07

We are (almost) all “Presenters”

we are all making some kind of presentations

00:09

00:11

Today's Topic

- **Introduction**
- **A story about web presentations**
 - the past
 - the present
- **deck.js Basics**
- **Extensions for deck.js**
- **Wrap up**

00:18

A story about web presentations

2004 – Powerpoint/OpenOffice/...

- **Inconsistent style**

no easy way to enforce constant position, scale etc

- **Portability issues**

even in 2011 and with latest versions!

- **VCS :(**

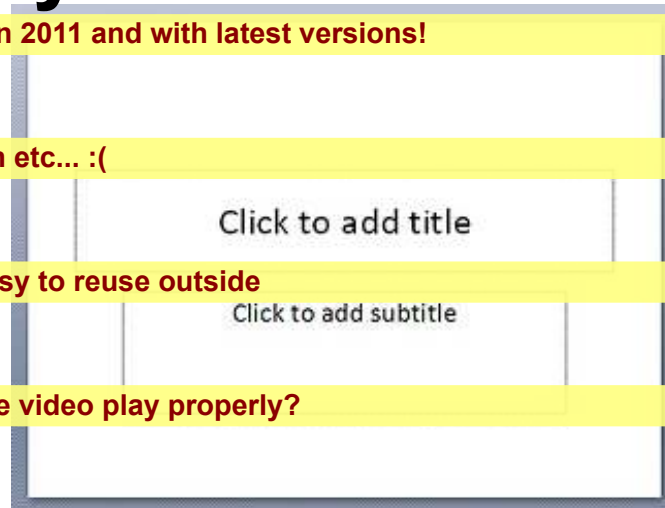

git svn etc... :(

- **Lock-in**

not easy to reuse outside

- **Media :(**

will the video play properly?

2005 – Latex Beamer

may look like a good idea if you use latex for papers

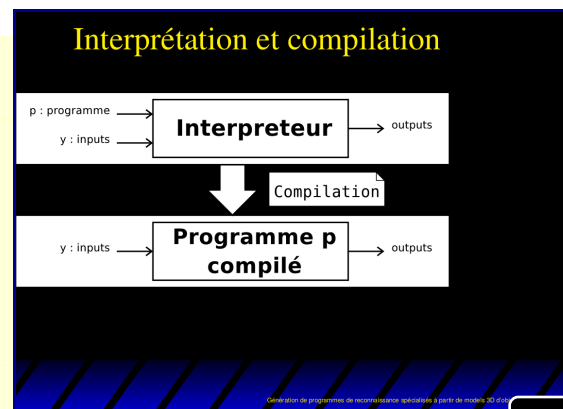

■ It's L^AT_EX :

- VCS
- math, latex skills, etc
- full programming language

Table of contents	
Section no.1	Subsection no.1.1
Section no. 2	Lists I Lists II
Section no.3	Tables

■ It's L^AT_EX :(

- how to style?
- how to include (SVG) graphics?
- need compilation
- produces static pdfs

2005 – Web Pages Generation

more as an experimental idea

■ S5: An Introduction

Eric A. Meyer

Complex Spiral Consulting

What Is S5?

- It's a **S**imple **S**tandards-based **S**lide **S**how **S**ystem
- One XHTML document provides all of the slide show's content
- CSS handles the layout and look of the slides
- JavaScript handles the dynamic aspects of the show
- That's all there is to it!

Operatic Origins

- Opera 4 introduced Opera Show, a projection-mode style sheet technology
- Allows a single XHTML document to be turned into a PowerPoint-like slide show
- Adding screen and print style sheets allows for multi-medium views of a single document

2006-2012 – Hacked S5

probably as everybody, I customized S5

- **Operational**
- **Feature rich: SVG, animations, ...**
presenter view, fitting, ... (better than any alternative)
- **But, used by me only**
- **Some limitations**
 - **compiled**
 - **technically tricky (to code and for browser)**
injection of style and js in SVG

00:39

2012 – The Questioning

00:41

A story about web presentations (back to the present)

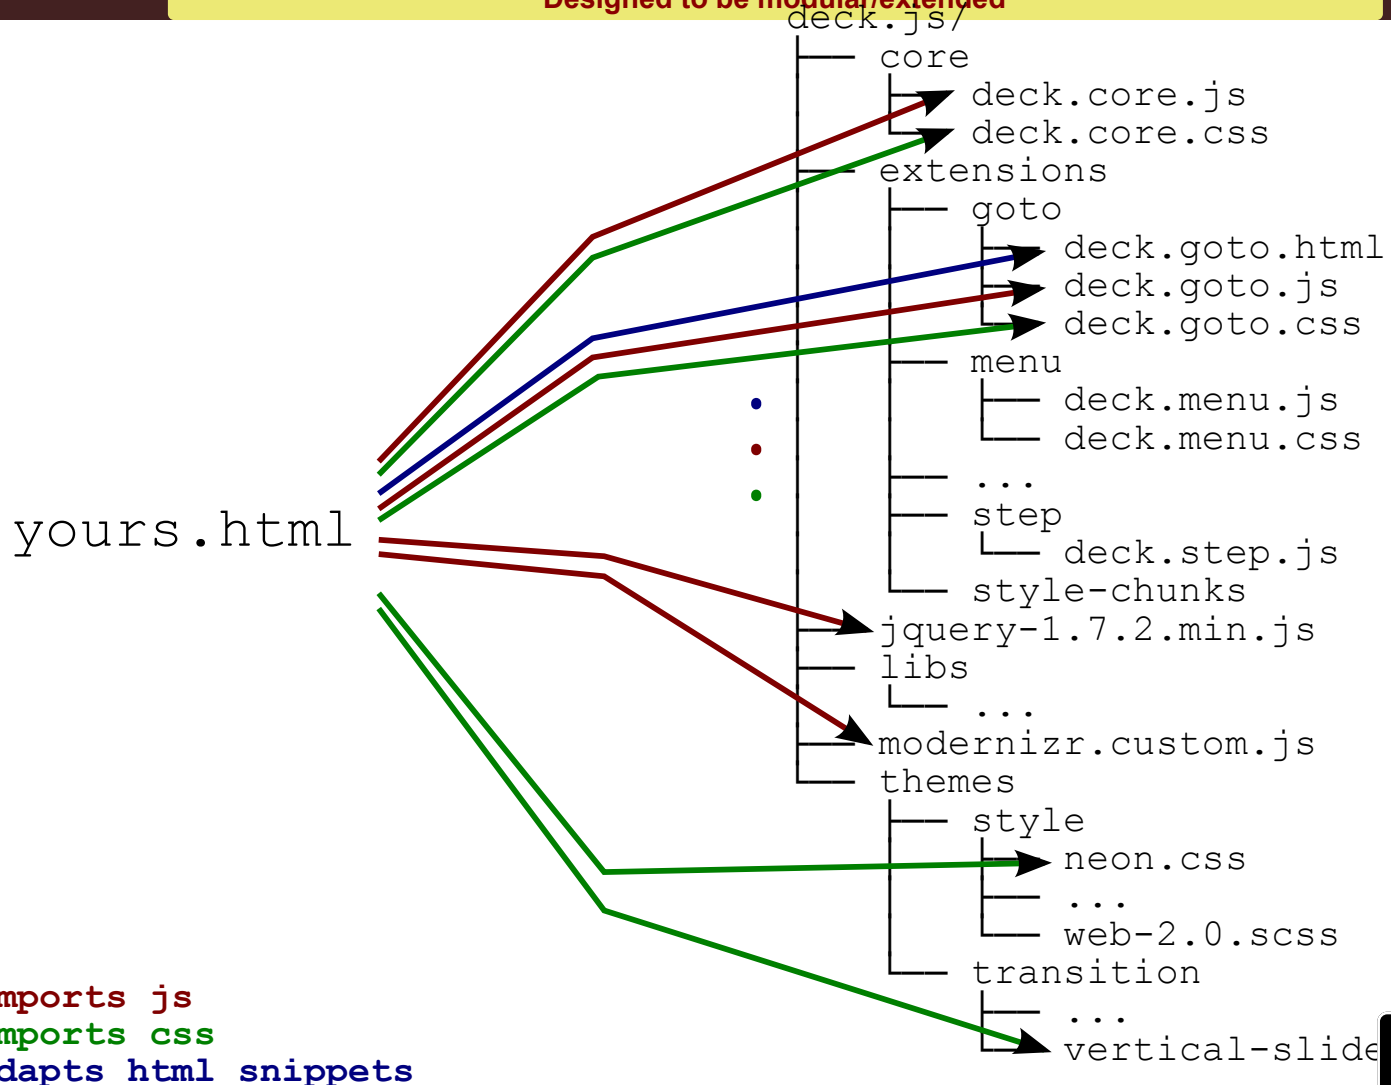

00:48

00:51

deck.js Basics

deck.js Architecture

Designed to be modular/extended

deck.js Example [click to try](#)

view frame source if interested (not critical for the rest)

<http://imakewebthings.com/deck.js/introduction/>

deck.js: Include Core

include libs,core,style /// call deck potentially with an option object

```
1  ...
2  <script src="deck.js/modernizr.custom.js"></script>
3  <script src="deck.js/jquery-1.7.2.min.js"></script>
4
5  <link href="deck.js/core/deck.core.css" rel="stylesheet" >
6  <script src="deck.js/core/deck.core.js"></script>
7  <link rel="stylesheet" href="deck.js/themes/style/web-2.0.css">
8
9  ...
10 <script>
11   jQuery(function() {
12     var cfg = {
13       keys: {
14         goto: 71 // 'g'
15       },
16       countNested: true
17     };
18     $.deck('.slide', cfg)
19   });
20 </script>
21 ...
22 <div class="deck-container">
23   <section class="slide title-slide">
24     <h1>SoftShake is Amazing</h1>
25   </section>
26   <section class="slide">
27     <ul>
28       <li>...</li>
29     </ul>
30   </section>
31 </div>
32
33
```

Extensions for deck.js

deck.js ext: included ones

default ext (the verbose way): css + js + html snippet */// try 'g' and 'm'*

```
1  ...
2  <link rel="stylesheet" href="deck.js/extensions/goto/deck.goto.css">
3  <script src="deck.js/extensions/goto/deck.goto.js"></script>
4
5  <!-- slide number indicator (uses "status snippet" at the end of the page)
6  <link rel="stylesheet" href="deck.js/extensions/status/deck.status.css">
7  <script src="deck.js/extensions/status/deck.status.js"></script>
8
9  <!-- navigation buttons (uses "navigation snippet" at the end of the page)
10 <link rel="stylesheet" href="deck.js/extensions/navigation/deck.navigation.c
11 <script src="deck.js/extensions/navigation/deck.navigation.js"></script>
12
13 <!-- slide selector by typing 'm' -->
14 <script src="deck.js/extensions/menu/deck.menu.js"></script>
15 <link rel="stylesheet" href="deck.js/extensions/menu/deck.menu.css">
16
17 ...
18
19 <p class="deck-status">slide: <span class="deck-status-current"></span> / <s
20
21 <!-- deck.goto snippet -->
22 <form action="." method="get" class="goto-form">
23   <label for="goto-slide">Go to slide:</label>
24   <input type="text" name="slidenum" id="goto-slide" list="goto-datalist">
25   <datalist id="goto-datalist"></datalist>
26   <input type="submit" value="Go">
27 </form>
28
29 <!-- deck.navigation snippet -->
30 <a href="#" class="deck-prev-link" title="Previous"></a>
31 <a href="#" class="deck-next-link" title="Next"></a>
```

deck.js ext.: includedeck

The amazing loader (cleans presentation file, shortens boilerplate code)

01:18

deck.js extensions: fit

proper fitting using CSS3, click inside to give focus

<http://home.heeere.com/data/deck-js-demo-2/samples/deck-fit.html>

deck.js extensions: clone

to have presenter tools around the presentation

- **clone, comments, stopwatch/timer**
- - when you press 'c' you get a clone window
 - you show the second window on the projector
 - you keep the first on your screen (with notes)
 - control the first window
 - get a "copy" of your cursor on the second
- - also a timer to know how fast you go
 - and a stopwatch when rehearsing
 - (move the mouse to the right edge of the window)
 - (logs are saved in html5 localStorage)

deck.js extensions: step, anim

<http://home.heeere.com/data/deck-js-demo-2/samples/deck-anim.html>

deck.js extensions: simplemath

simple script that produces mathml (out-of-the-box support in firefox)
can use mathjax also (but needs heavy install for offline use)

■ Latex notation for equations, etc

powerful notation for equations, etc

$$e = mc^2$$

$$\left(\frac{x^2}{y^3}\right)$$

$$\begin{bmatrix} \sqrt{x} & 2 \\ 3 & x^4 \end{bmatrix}$$

$$f(n) = \begin{cases} n/2 & \text{if } n \text{ is even} \\ -(n+1)/2 & \text{if } n \text{ is odd} \end{cases}$$

$$a^2 + \frac{1}{\sqrt{a^2 + \frac{1}{\sqrt{a^2 + \frac{1}{\sqrt{a^2 + b^\infty}}}}}}$$

deck.js extensions: svg

Vector graphics (12k for the smiley) /// give focus to see presentation

<http://home.heeere.com/data/deck-js-demo-2/samples/deck-svg.html>

deck.js ext.: smartsyntax

shorter way of writing slides, knows about extensions (e.g., anim)

- **Markdown inspired syntax**

but markdown is limited (no easy way for adding classes and ids)

- **Adds some features**

1. **easy slide block creation**

2. **easy addition of classes and ids**

3. **extension specific “tags”**

```
=deck.js extensions: smartsyntax=[e]#smartdemo
* Markdown inspired syntax
* Adds some features
*# easy slide block creation
*# easy addition of classes and ids[inred]
*# extension specific “tags”
```

deck.js ext.: smartsyntax

easily animate any html or svg element + play/pause videos (even with a remote control) (even with some clones)

```
=deck.js extensions: smartsyntax=[e]  
* Example[inred]  
@CSS!: .inred {color: red;}  
@SVG:myclass,floatright media/smiley.svg 300px 300px  
@anim-appear:400: #innerEye1
```

■ Example

deck.js ext.: smartsyntax

easily animate any html or svg element + play/pause videos (even with a remote control) (even with some clones)

```
=deck.js extensions: smartsyntax=[e]  
* Example[inred]  
@CSS!: .inred {color: red;}  
@SVG:myclass,floatright media/smiley.svg 300px 300px  
@anim-appear:400: #innerEye1 | #innerEye2 | -#innerEye1 + -#innerEye2  
@anim-appear:1000: #innerEye1 + #innerEye2 + #shadow  
@anim-play: .myvideo  
@anim-pause: .myvideo
```

■ Example

deck.js extensions: short list

■ Base

- status, navigation
- menu, goto

■ Mine

- includedeck, fit, clone, "comments", timer
- maths, SVG, step, anim, autoshow
- smartsyntax

autoshow == the loopy thing on the first page

■ Other

- codemirror, blank, search, automatic, annotate, lazyload, ...

deck.js extensions: how to

■ Get included by the user

- do initialization on DOM ready
- **deck.js ready:** `$(document).bind('deck.init', function() { ... })`

■ Add and use options

- `$.extend(true, $[deck].defaults, { ... });`
- `var opts = $[deck]('getOptions');`

■ Interact with deck.js (and your DOM)

- **listen to events:** `$(document).bind('deck.change', ...)`
- **act on deck.js:** `$[deck]('getSlides')` `$[deck]('next')`

...

Wrap up

Summary, Discussion

■ Why web presentations?

- portable (need a decent browser)
- tuning friendly (reuse web skills, if any)
- git friendly (plain text)
BUT do not need to know web at all (not even html...)
- modern looking (media, animations, styles)
- ! no visual editor (yet)
some actually starting to appear (slid.es, dahu screencast)

Summary, Discussion

■ Why deck.js?

- stable and used
- clear extension policy
- lot of amazing extensions

- dizziness free (vs prezi (flash), impress.js)

production ready, scaling, ...

deck.js can do funky transitions and funky 3D css transforms but it is not the norm

and reuse is easier when no absolute layout

Take-Home Message

- Use a web presentation framework
- Preferably deck.js :)
- Use and write extensions
- Clone from github or **get a bundle**

we all gain by sharing
